TITLE: Threshold characteristics of CdS photoresistors

SOURCE: Radiotekhnika i elektronika, v. 12, no. 1, 1967, 98-105

TOPIC TAGS: photoresistor, photosensitivity, *Cadmium sulfide*

ABSTRACT: The voltage and photosensitivity of CdS photoresistors was experimentally studied to establish the application of the photoresistors in recording weak alternating light signals. The 4 x 1-mm film specimens were prepared from CdS single crystals (50-100 μ thick) obtained by vapor-phase synthesis of Cd and S on a glass substrate. The noiseless contacts were made by vacuum deposition of indium on the ends of the specimens (the photosensitive area is 1 mm<sup>2</sup>). The experiment shows that both high- and low-resistance photoresistors have a minimum sensitivity threshold [(3-6) x 10<sup>-10</sup> lm cps<sup>-1/2</sup> (1.5-3) x 10<sup>-11</sup> w cps<sup>-1/2</sup>] at 1-10 lux illumination for a light source with a color temperature corresponding to 2854K. The sensitivity threshold for light pulses in the spectral range of CdS maximum sensitivity (λ = 0.51 μ) is 5 x 10<sup>-13</sup> w cps<sup>-1/2</sup> at 10 lux white light illumination. The voltage

TITLE: Investigation of the phenomenological quantum yield from the photoconductive effect in the CdS single crystal

SOURCE: Ukrayins'kyi fizychnyy zhurnal, v. 8, no. 5, 1963, 598-599

TOPIC TAGS: cadmium sulfide crystal, phenomenological quantum yield, cadmium sulfide photoresistor

ABSTRACT: The relation between phenomenological quantum yield (PQY) and the intensity of constant bias lighting in a wide range of specimen illuminations by short light pulses has been experimentally investigated by measuring the photo response. The experiments show that the PQY for specimens with low dark conductivity ( $10^{-10}$  mho) increases with bias lighting, rises to a maximum, and then decreases at comparatively high bias lighting. The PQY for a specimen with a  $10^{-7}$  to  $10^{-6}$  mho dark conductivity decreases monotonically with an increase in bias lighting. The PQY for the majority of specimens varied within 0.01 to 0.02 electron/quantum. The authors conclude that the sensitivity threshold of CdS photoresistors can be increased either by adding certain impurities to the

Microorganisms.

Orig Pub : Aptech. delo, 1956, No 3, 38-43.

Abstract : It was demonstrated by growing E. coli, Proteus and Staphylococci on meat-peptone media containing 0.5-1% pyramidon, antipyntine or caffeine that multiplication of the organisms was retarded, especially in the presence of pyramidon, and that their sugar fermenting and proteolytic activity was suppressed. It was found that microbes destroyed pyramidon and antipyntine molecules by the utilization of carbon and nitrogen.

**TEXT:** The method of determining tin and titanium in industrial binary alloys was checked. Tin is determined iodometrically in the presence of titanium; titanium is determined by precipitation with cupferron after the separation of tin (by precipitation with hydrogen sulphide in the presence of citric acid. The tin determination was carried out both in the presence of vanadium and after separation from vanadium. It was found that the industrial method of determining tin in the presence of vanadium was satisfactory. The analytical procedure is described in some detail. There are 2 tables.

TITLE: Determination of decarburization in bright-drawn high-speed steel by the thermoelectric potential method

SOURCE: Zavodskaya laboratoriya, v. 32, no. 6, 1966, 719-720

TOPIC TAGS: thermoelectric sensor, decarburization, high speed steel, carbon steel/ R9 tool steel, R18 tool steel

ABSTRACT: A method for determining decarburization in bright-drawn high-speed steel is briefly described. The method is based on measuring the thermoelectric potential between the metal surface and a copper electrode clamped to the surface, and by comparing this potential with the potential obtained between couples of known composition. Experiments were performed on steels R9, R18, and others (not listed in report) using a copper electrode at 160--170C (some results are tabulated). The decarburization criterion is specified by GOST 5952-63 as <0.7% carbon in the surface layer for steel R18 and <0.85% for steel R9. It was found that a meter reading of >7 (unspecified scale) indicated decarburization in 72--100% of the specimens (checked by chemical analysis). It was concluded that this method is sufficiently sensitive to carbon content in the surface layer to be of practical importance. Orig. art. has: 1 figure and 1 table.

**TITLE:**

The Sign of the Double Diffraction of Rays in a Flow as Dependent on the Concentration of the Solution of a Polymer  
(Zavisimost' znaka dvoynogo lucheprelomleniya v potoke ot koncentratsii rastvora polimera)

**PERIODICAL:**

Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 3, pp. 491 - 493  
(USSR)

**ABSTRACT:**

The double refraction of rays in the flow of polymer solutions is determined by the difference of the main polarizabilities of the macromolecule in the solution. The macromolecule in the solution may be considered an ellipsoidal particle which is saturated with the solvent. The refraction index of the solvent is here different from the refraction index of the polymer. At first an already earlier found formula for these difference of the polarizabilities is given. The anisotropy proper of the molecule can be positive or negative according to its form, but the anisotropy of the form is always positive. In a macromolecule with negative anisotropy the sign of the resulting difference of the polarizability is dependent on the share of the individual terms

Card 1/3

2073-19/59

The Sign of the Double Diffraction of Rays in a Flow as Dependent on the Concentration of the Solution of a Polymer

of the above-mentioned formula. In the case of a laminar flow in the solution the share of the individual term is in different dependence on the hydrodynamic force applied to the macromolecule and therefore also on the velocity gradient  $g$ . In the case of  $g \rightarrow 0$  and an alteration of the molecular weight a change of the optical anisotropy can be expected in one and the same solvent. This phenomenon was already earlier discovered during the investigation of the solution of two fractions ( $M = 3 \cdot 10^5$  and  $M = 100 \cdot 10^5$ ) of polystyrene in dioxane. The solutions of the low-molecular fraction have a negative double refraction in a wide domain of concentrations and velocity gradients. The solutions of the high-molecular fraction had a positive double refraction, but only at small velocity gradients  $g$ . With increasing  $g$  the positive refraction of rays becomes smaller, then it passes through zero and thereafter becomes strongly negative. A diagram illustrates the dependence of the amount  $\Delta n$  of the double refraction on the velocity gradient  $g$  for solutions with various concentration. According to the authors the double refraction in the case of sufficiently high concentrations must only be due to the anisotropy proper. There are 2 figures and 15 references, 7 of which are Slavic.

TITLE: On the Applicability of the Method of Velocity Measurement of Surface Recombination by Means of the Change of Semiconductor Resistance in a Magnetic Field (O primenimosti metoda izmereniya skorosti poverkhnostnoy rekombinatsii po izmeneniyu soprotivleniya poluprovodnika v magnitnom pole)

PERIODICAL: Zhurnal Tekhnicheskoy Fiziki, 1958, Vol. 28, Nr 5, pp. 1051-1052 (USSR)

ABSTRACT: In the paper by Zhuze, Pikus and Sorokin (Ref 1) a new method of measuring the surface recombination velocity  $s$  by means of the modification of the resistance of a thin semiconductor sample in a magnetic field was proposed. The author of this letter to the editor employed the described method in the investigation of the modification  $s$  according to the change of the electric surface potential. The measurements were conducted with two devices. One served for the measurement of the constant component  $E_c$ , one of the sample surface, being subjected to the action of a constant transverse field or of various gas media. On the other device the voltage of the doubled frequency  $E_{2\omega}$  was mea-

Card 1/2

On the Applicability of the Method of Velocity Measurement of Surface Recombination by Means of the Change of Semiconductor Resistance in a Magnetic Field 57-28-5-23/36

sured, one of the surface media being subjected to the action of a sinusoidal transverse field with low frequency. The obtained results show, that the method of measuring the surface recombination velocity by means of the modification of the conductivity of the samples in a magnetic field yields correct values of  $\Delta_s$  at a modification of the concentration of the recombination centers which was also proved by grinding experiments. If  $s$  changes because of the modification of the electrostatic surface potential, this method, however, gives too low values. This can be seen from a direct comparison of this method with the bridge method of measuring the effective life. The authors thank Yu.F. Novototskiy-Vlasov for his help. There are 1 figure and 5 references, 4 of which are Soviet.

AUTHORS: Rzhanov, A. V. and Arkhipova, I. A.  
TITLE: Surface recombination in germanium with raised injection levels  
PERIODICAL: Fizika tverdogo tela, v. 3, no. 7, 1961, 1954 - 1959

TEXT: The authors report on measurements of the surface recombination rate as a function of the surface potential for different injection levels. They also give a comparison with the theory. This problem is of interest since today a large number of semiconductor devices operate at increased injection levels (where the concentration of the non-equilibrium carriers equals or exceeds that of the equilibrium carriers) and because it has hitherto not been studied experimentally. In the laboratory of the authors a method was devised for the combined study of steady photoconductivity and field effect, which can be employed for different injection levels. It is based on the following principle: A rectangular germanium plate is covered by 2 mica foils and fixed between two glass plates to the inner surfaces of which the transparent tin oxide electrodes

Card 1/5

25682  
 -S/181/61/003/007/004/023  
 B102/B202

Surface recombination ...

are fitted. A sinusoidal transverse voltage is applied to this two-sided capacitor which simultaneously is exposed through the electrodes to square light pulses of equal intensity but different repetition frequency. Under these conditions, three curves can simultaneously be observed on the oscilloscope screen: The curve of the conductivity variation in the dark, and the conductivity curves for one- and two-sided exposure (with double total intensity). The surface dark potential can be determined from the former, the steady photoconductivity is determined from the ordinate difference between first and second curve. From this difference, the effective lifetime and surface recombination rate are determined if the calibration coefficient (which is determined from the second and third curves) is known. The theoretical considerations are based on the formula for the surface recombination rate

$$S = \frac{N_s (\sigma_p \sigma_n)^{1/2} \frac{1}{2} (\lambda + \lambda^{-1}) \left[ 1 + \delta \left( \frac{1}{\lambda + \lambda^{-1}} \right) \right]}{\text{ch} \left( Y_s - \ln \lambda - \frac{q \epsilon_0}{kT} \right) + \text{ch} \left( \frac{e_i - q \epsilon_0}{kT} \right) + \delta \text{ch} \left( Y_s - \frac{q \epsilon_0}{kT} \right)} \quad (1)$$

where  $Y_s$  is the surface potential in a recombination via centers of concentration  $N_t$  with energy levels  $\epsilon_t = E_t - E_1$ ,  $\alpha_p$  and  $\alpha_n$  are the hole and electron trapping constants,  $n_0$  and  $p_0$  are the balanced volume concentrations of electrons and holes,  $\delta = \frac{\Delta n}{n_1} = \frac{\Delta p}{n_1}$  is the injection level and  $\lambda = p_0/n_1 = n_1/n_0$ ;  $q\xi_0/kT = \frac{1}{2} \ln \frac{\alpha_p}{\alpha_n}$ . With increasing  $\delta$ , the position of the maximum of the curve  $S = f(Y_s)$  is shifted from  $Y_s' = \frac{q\xi_0}{kT} + \ln \lambda$  (for small  $\delta$ ) to  $Y_s'' = q\xi_0/kT$  for large  $\delta$ . If (1) is written in the form

$$S = S_0 \frac{1 + \delta \left( \frac{1}{\lambda + \lambda^{-1}} \right)}{\text{ch} \left( Y_s - \frac{q\xi_0}{kT} \right)} \cdot \quad (4)$$

$$1 + \delta \frac{1}{\text{ch} \left( Y_s - \ln \lambda - \frac{q\xi_0}{kT} \right) + \text{ch} \left( \frac{q\xi_0}{kT} \right)}$$

Card 3/5

Surface recombination ....

where  $S_0$  is the surface recombination rate for small  $\delta$ , the variation of the maximum surface recombination rate with the injection level becomes manifest. (4) shows that also at relatively small  $\delta$ , the maximum surface recombination rate decreases with the injection level if  $\frac{1}{2}(\lambda + \lambda^{-1}) > 1 + \text{ch}(\frac{E_t - q\phi_0}{kT})$ , and increases with the injection level if  $\frac{1}{2}(\lambda + \lambda^{-1}) < 1 + \text{ch}(\frac{E_t - q\phi_0}{kT})$ . With large  $\delta$   $S_{\text{max}}$  decreases with increasing  $\delta$ , if  $\frac{1}{2}(\lambda + \lambda^{-1}) > \text{ch}(\frac{E_t - q\phi_0}{kT})$  and with a further increase of  $\delta$ ,  $S$  approaches the value  $S_{\delta \rightarrow \infty} = N_t \frac{\alpha_p}{\alpha_p + \alpha_n}$ .

In the following, these results are applied to practical cases. A comparison of the theoretical results with the experimental ones for the two extreme values  $\delta = 0.1$  and  $\delta = 4.3$  showed good agreement. The authors thank A. L. Vol'sk, Member of Warsaw University, for assistance and advice. There are 2 figures and 8 references: 6 Soviet-bloc and 2 non-Soviet-bloc. TITLE: Surface recombination on germanium with a large quantity of water adsorbed

PERIODICAL: Fizika tverdogo tela, v. 4, no. 5, 1962, 1274 - 1278

TEXT: The changes in the character of the recombination curves during gradual drying of p-type germanium were examined. Conclusions: Virtually no quantitative relationship exists between the changes in the maximum surface recombination rate of germanium with adsorbed water and the slope of the capture curves. Recombination is accomplished at discrete levels as well as on continuous energy levels in the surface forbidden band. As a first approximation it is assumed that the effective capture cross sections of the discrete and continuous levels are determined only by the donor or acceptor character of the respective centers and that they are independent of the energy position of the level. An approximately linear increase of the recombination rate on the side of positive surface potentials was observed on the p-type specimens (resistivity ~20 ohm.cm).

TITLE: Hydrolysis of terephthalodinitrile with aqueous ammonia under pressure

PERIODICAL: Zhurnal obshchey khimii, v. 33, no. 2, 1963,  
637 - 641

TEXT: The above reaction was studied to determine the possibility of selectively preparing the desired intermediate products. Terephthalodinitrile (TDN), prepared by the oxidative ammonolysis of p-xylene of Pb vanadate, was reacted with aqueous ammonia (taken in various TDN: ammonia:water molar ratios, n) at 200-300°C, in a stainless steel autoclave under pressures from 5 to 40 atm., over 3 hours. For n = 1:14:210, the yields of the diammonium salt of terephthalic acid (I) increased from ~ 30 % at 200°C to ~ 100 % at 300°C, whilst the yields of  $\text{NH}_4\text{COOC}_6\text{H}_4\text{CONH}_2$  (II) fell from ~ 50 % at 200°C to ~ 10 % at 250°C. At 200°C, with TDN:H<sub>2</sub>O = 1:210, increasing the molar ratio of NH<sub>3</sub>:TDN to 8 favored the formation of I and II, whilst 30-40 % of

Card 1/2

each of  $\text{NH}_2\text{COC}_6\text{H}_4\text{CN}$  and  $\text{NH}_2\text{COC}_6\text{H}_4\text{CONH}_2$  was formed at  $\text{NH}_3:\text{TDN} = 1-2$ .  
A small amount of ammonium p-cyanobenzoate was also formed with low concentrations of  $\text{NH}_3$ . At  $250^\circ\text{C}$ , increased concentrations of water promoted the rate of reaction and favored the formation of the final products of hydrolysis. During the formation of  $-\text{CONH}_2$  from  $-\text{CN}$ , the ammonia behaved only as a catalyst; in the conversion of  $-\text{CONH}_2$  to  $\text{COONH}_4$ , however, considerably higher concentrations of  $\text{NH}_3$  were required. There are 3 figures.

AUTHOR: Koton, M. M.; Kiseleva, T. M.; Arkhipova, I. L.

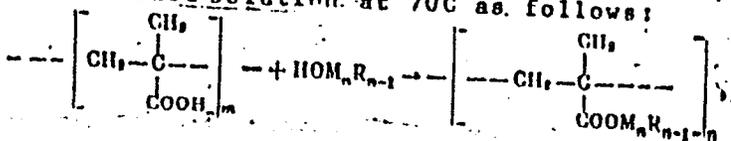

TITLE: Synthesis of metal-containing polymers by reaction in a poly(methacrylic acid) chain

SOURCE: Vy\*sokomolekulyarny\*ye soyedineniya, v. 6, no. 8, 1964, 1496-1497

TOPIC TAGS: metal containing polymer, metal containing polymer synthesis, poly(tri-n-butyltin methacrylate), poly(triphenyltin methacrylate), poly(diphenylantimony methacrylate), poly(triphenyllead methacrylate), poly(phenylmercury methacrylate), thermostable polymer

ABSTRACT: Thermally stable organometallic copolymers which are soluble in organic solvents were synthesized by reacting poly(methacrylic acid) with alkyl- or aryl-metal hydroxides. The copolymers were synthesized in alcohol solution at 70C as follows:

Card 1/3

ACCESSION NR: AP4043789

where M is Sn, Pb, Hg, or Sb, and R is C<sub>6</sub>H<sub>5</sub> or C<sub>4</sub>H<sub>9</sub>. The synthesized copolymers were poly(tri-n-butyltin methacrylate), which is soluble in benzene, toluene, dimethylformamide; poly(triphenyltin methacrylate), which is partially soluble in dimethylformamide; poly(triphenyllead methacrylate), which is insoluble in organic solvents; poly(diphenylantimony methacrylate), which is soluble in dimethylformamide; and poly(phenylmercury methacrylate), which is soluble in dimethylformamide. Depending on the viscosity of poly(methacrylic acid), various copolymers of tri-n-butyltin methacrylate, ranging from rubber-like to solid-type, were obtained. The structure of the synthesized copolymers was proven by the hydrolysis of poly(triphenyltin methacrylate), which yielded pure triphenyltin hydroxide. It is noted that the thermal stability of the copolymers is not lower than that of homopolymers of the respective organometallic monomers. Orig. art. has: 1 formula.

Akademiya nauk SSSR. Laboratoriya sistem peredachi informatsii

Problemy peredachi informatsii, vyp. 2 (Problems of Information Transfer, Nr. 2) Moscow, Izd-vo AN SSSR, 1959. 99 p. Errata slip inserted. 2,000 copies printed.

Ed. of Publishing House: Ye.K. Vinnichenko; Tech. Ed.: Yu. Rykina; Editorial Board: A.A. Kharkevich (Resp. Ed.), V.N. Kuznetsov, I.A. Ovseyevich, V.N. Roginskiy, and V.G. Solomonov.

**PURPOSE:** This collection of articles may be useful to engineers engaged in the design of wire communication systems.

**COVERAGE:** The authors discuss the theory of transmission of information and describe methods used in transmission. They consider attenuation of a two-wire line and cable impedance and discuss problems of coding, decoding and predicting communication signals. They also consider statistical analysis of information and discuss systems used. No personalities are mentioned.

TITLE: Filtering the  $H_{01}$  Wave in a Waveguide With an Iris

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Energetika i avtomatika, 1960, Nr 1, pp 144-148 (USSR)

ABSTRACT: Separation of the  $H_{01}$  waves from higher modes of the same type ( $H_{02}$ ,  $H_{03}$ , etc) in cylindrical waveguides is considered an important problem in long-range waveguide communication. The difficulty lies in the fact that  $H_{02}$ ,  $H_{03}$ , ... waves have the same structure as the  $H_{01}$ , i.e. they do not have a longitudinal electric component along the waveguide walls; thus, they pass without attenuation through any known filter designed to suppress waves with such a component. The article contains the results of theoretical study on the possibility of filtering out the  $H_{01}$  waves by means of waveguide's irises, thin discs with openings of equal radii in the centre of each. The irises are distributed uniformly along the

Filtering the  $H_{01}$  Wave in a Waveguide With an Iris

length of the waveguide. To simplify calculations the conductivity of the dielectric inside the waveguide is assumed zero and the conductivity of the metallic walls of the waveguide and of the iris are assumed infinitely large. In the first paragraph, the electromagnetic field in a waveguide with irises is considered. In the second paragraph, the boundary conditions and the transcendent equations for constant transmission are given. In the third paragraph, an approximate method of calculating the wave filter is described and the derived formulae are utilised for calculating the practical example of a waveguide filter with the following data: wavelength - 0.54 to 0.68 cm, iris opening - 0.6 cm, waveguide diameter - 2.4 cm, spacing between the irises - 2.4 cm. There are 3 Soviet references.

TITLE: H<sub>0m</sub>-waves in a diaphragmed waveguide

SOURCE: Akademiya nauk SSSR. Laboratoriya sistem peredachi informatsii. Problemy peredachi informatsii, no.10, 1961, 108-118

TEXT: This paper was presented at the Seminar of the Laboratory held on May 16, 1959

In long distance waveguide communications lines using the H<sub>01</sub>-wave, all parasitic flow can be eliminated by using suitable filters which suppress waves having a longitudinal electric component which, however, does not function for the H<sub>0m</sub>-waves,  $m \gg 2$ . A round waveguide of the cross section shown in the figure is considered, where the dielectric constant in the interior of the waveguide is taken equal to zero and the conductivities of the metal walls and diaphragms taken infinite. The author first derives the transcendental equation for the propagation constant of the diaphragmed waveguide

TITLE: The calculation of the Kotel'nikov integral (Paper presented at a seminar of IPPI AN SSSR on 1 November 1962)

SOURCE: AN SSSR. Institut problem peredachi informatsii. Opoznanlye obrazov. Teoriya peredachi informatsii (Pattern recognition. Theory of information transmission). Moscow, Izd-vo Nauka, 1965, 147-150

TOPIC TAGS: integration, digital computer, computer application, algorithm

ABSTRACT: In various applications of the theory of probability and mathematical statistics calculation is often made of the Kotel'nikov integral

76, 44, 5

$$F(n, \alpha) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} [1 - \Phi^n(x)] e^{-\frac{(x-\alpha)^2}{2}} dx. \quad (1)$$

Card 1/3

2

L 17847-66

ACC NR: AT6004697

or the auxiliary integral

$$F_1(n, \alpha) = \int_{-\infty}^{\infty} \Phi^n(x) e^{-\frac{(x-\alpha)^2}{2}} dx \quad (2)$$

However, for certain values of  $\alpha$  and  $n$  the values of the integral are very close to unity, and since the computer can operate with a limited number of digits, the approach to unity cannot be carried out beyond a certain limit (0.999 999 999 in the case of Strela-3 computer). The author proposes an algorithm which avoids the difficulty by utilizing the small parameter approach (I. T. Turbovich, Metod blizkikh sistem, Fizmatgiz, 1961). Using the substitution

$$\Phi(x) = 1 - \delta_x, \quad (3)$$

where  $\delta_x$  is an auxiliary function of  $x$ , the integral under consideration becomes equal to a finite sum of  $n$  single kind integrals differing only in the power of  $\delta_x$ . Some values of the Kotel'nikov integral are listed in Table 1.

TITLE: The decomposition of apatite by hydrofluoric acid yielding phosphoric acid

40  
B

SOURCE: Khimicheskaya promyshlennost', no. 10, 1965, 757-758

TOPIC TAGS: fluorine, fluorine compound, hydrofluoric acid, filtration, phosphoric acid

ABSTRACT: The article gives the reaction and describes the flow schemes for the decomposition of apatite by hydrofluoric acid yielding phosphoric acid. The hydrofluoric acid for this purpose can be obtained from "poor" fluorspar with a large amount of impurity in the form of  $\text{SiO}_2$  which, when the ore is treated with sulfuric acid, forms fluosilicic acid which also forwards the decomposition of the apatite. The  $\text{CaF}_2$  obtained from the two stage decomposition reaction can be used to prepare pure hydrofluoric acid. In the experiments technical hydrofluoric acid containing  $\sim 33\%$  HF and  $\sim 5\%$   $\text{H}_2\text{SiF}_6$  was used. The experiments proceeded at  $\sim 100^\circ\text{C}$  in a laboratory reaction vessels

fitted with an electric heater and a mixer and lasted about 30 min. The filtration rate of the precipitate reckoned in dry precipitate was 1,400 kg/(m<sup>2</sup>.hr). The phosphoric acid yield contained 45-48% P<sub>2</sub>O<sub>5</sub>, 0.3-0.6% CaO and 5-8% F and can be used for the production of double superphosphate or of ammonium phosphates. The flow scheme for the preparation of double superphosphate through the reaction of phosphoric acid and calcium fluoride is also given. Orig. art. has 3 figures and 4 formulas.

TITLE: Symposium on Tin Economy in Tin-Plate Manufacture. (Ekonomiya olova pri proizvodstve beloy zhesti)

PERIODICAL: Metallurg, 1957, Nr 7, pp.30-34 (USSR)

ABSTRACT: The tin consumed in hot-dip tinning accounts for about half the cost of the tin-plate; only 75-80% of the tin is used for coating the sheet, the rest goes into various waste products: mainly flux and oil scum and crystals of the alloy  $FeSn_2$  embedded in lumps of pure metallic tin. Recently ways of extracting tin from these waste products have been developed at various Soviet works and these are described in this symposium. The first contribution (pp.30-32) is by M. S. Arkhipova and V.D. Mishin of the Ural Polytechnic Institute and N.S. Smirnov of the Seversk Metallurgical Works. This describes pilot-plant work on the development of a hydro-metallurgical method of extracting tin from flux scum at the Seversk works; a full-scale plant has been working there since 1954. Flow diagrams for the process are given, together with a graph showing degree of extraction of tin against time of cementation, and optimal conditions are summarised. In the

TITLE: Diffusion of silver in polycrystalline gold

SOURCE: <sup>16</sup> Fizika metallov i <sup>27</sup> metallovedeniye, v. 20, no. 3, 1965, 390-395

TOPIC TAGS: silver, gold, volumetric analysis, crystal structure, polycrystal, metal diffusion

ABSTRACT: The present work is a continuation of an earlier investigation by the authors (FTT, 1964, 5, 11, 3978 and FMM, 1963, 16, 4, 611) who needed to know the diffusion of silver in polycrystalline gold in order to continue their research on the effect of an electric field on the intercrystalline diffusion of silver. The volumetric diffusion  $D_v$  of silver in gold at 770 - 1040C was determined first by using two methods: (1) the relation of integral intensity I of the  $\gamma$  component of the radiation of silver 110 on the depth of diffusion penetration x, and (2)

Card 1/2

UDC: 539.292 :548.0 <sup>2</sup>

L 16176-66

ACG NR: AP5025323

by the direct use of measured values of integral activity. The effect of temperature on the value of  $D_v$  was represented by the straight line in the coordinates  $\log D_v = f(1/T)$ . The formula was derived for the calculation of volumetric diffusion of silver into polymetallic gold:

$$D_{os} = 0,083 \exp \left( -\frac{40400 \pm 500}{RT} \right) \text{ cm}^2/\text{cek.}$$

This agreed well with the results obtained by Mallard et al. (Phys. Rev., 1963, 129, 2, 617). Diffusion annealing at a temperature range of 540- 2750 was made for determining the coefficient of intergranular diffusion  $D_g$ . Calculation of  $D_g$  was made by the Fisher method (J. Appl. Phys., 1951, 22, 74). The final equation is

$$\delta D_{gp} = 9,5 \cdot 10^{-10} \exp \left( -\frac{16200 \pm 800}{RT} \right) \text{ cm}^2/\text{cek.}$$

where  $\delta$  is the semiwidth of the grain boundary. Orig. art. has: 7 formulas, 6 figures and 1 table.
